Vitamin D and HIV: shine a light

J Currier

From Tenth International Congress on Drug Therapy in HIV Infection Glasgow, UK. 7-11 November 2010

Over the past several years there has been growing interest in the high prevalence of vitamin D deficiency in both the general population and among people living with HIV infection. Vitamin D deficiency in the setting of HIV infection is likely multi-factorial with contributions from environmental factors as well as possible associations with HIV therapy. This lecture will highlight recent data on the prevalence and possible consequences of vitamin D deficiency in the setting of HIV with a focus on the relationship between vitamin D deficiency and HIV disease progression and possible metabolic and inflammatory consequences of chronic vitamin D deficiency. Finally, the talk will attempt to shine a light on areas for further investigation.
